Spring 2018 Org II Exam #1 Ch 14-17 (50 points)

Name: _____

*If you do **not** want your graded exam placed in the box outside my office, then please check here* ☐

1-10 are True / False. (10pts)

1) *Aromaticity* is a term used to describe very stable π bonding in certain special molecules.

2) The oxygen atoms in oxetane and 1,4-dioxane are all sp^3 hybridized.

3) *Conjugation* involves the sideways overlap of 3 or more adjacent and aligned p orbitals.

4) Kinetic products are always formed more quickly than thermodynamic products.

5)  is more stable than 
6) For EAS reactions, alkyl groups are *ortho/para* directing, whereas acyl groups are *meta* directing.

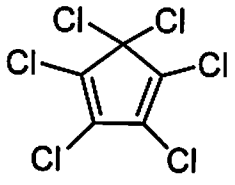
7)  is a *non-bonding* Molecular Orbital.

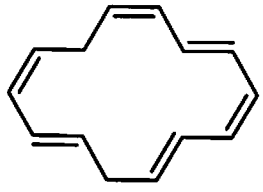
8) For EAS, *all* deactivating substituents are *meta* directors.

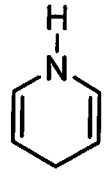
9) Friedel-Crafts *alkylations* produce acylium ion electrophiles which are resonance stabilized and so do not undergo carbocation rearrangement.

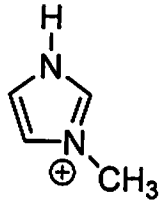
10) For Diels-Alder reactions, the diene must adopt an *s-trans* conformation.

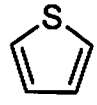
11) Indicate which of the following molecules are *aromatic*, *non-aromatic* or *anti-aromatic*. (<u>Assume all the species are **planar**</u>). (10pts)

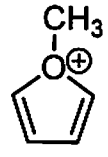


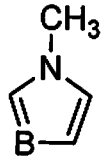


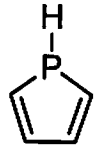


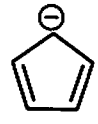






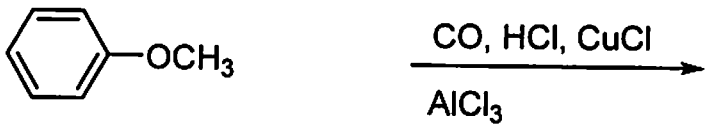


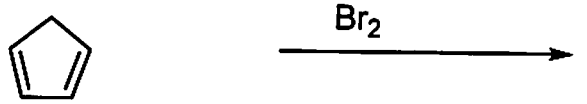


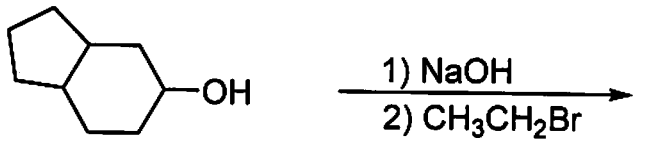


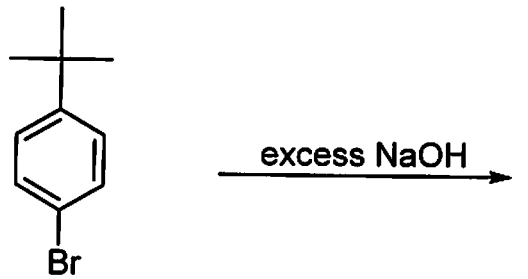
12) Provide a topic (or problem) for which Molecular Orbital Theory provided a superior explanation. (1pt)

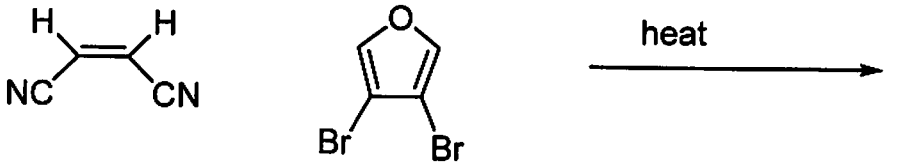
13) Predict the major products in the following reactions, *paying attention to regio/stereochemistry and isomeric products*, where applicable. (12pts)



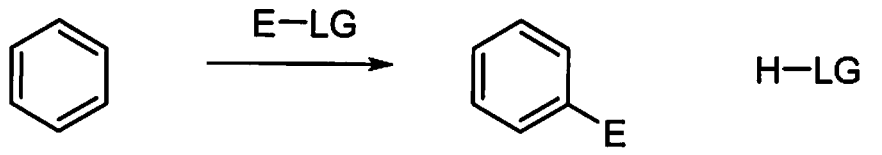




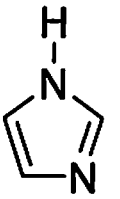




14) Write the mechanism (*i.e. curly arrows*) for the following generic Electrophilic Aromatic Substitution. (*You do **not** need to draw all the resonance structures of the intermediate sigma complex*). (4pts)



15) Circle the *more basic* Nitrogen in the Imidazole ring below. (1pt).



16) Draw *meta*-diFluoroBenzene. (1pt).

17) (4x2=8pts) For each pair of reactions (a-d), one reaction works better than the other. Indicate which one works best, and write a single sentence to explain why.

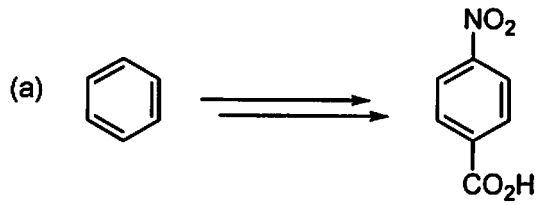
a) 
Reason:

b) 
Reason:

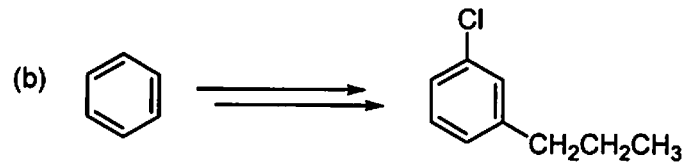
c) 
Reason:

d) 
Reason:

18) Provide reagents for *either* (a) <u>*or*</u> (b) which are obviously multistep transformations. (3pts)

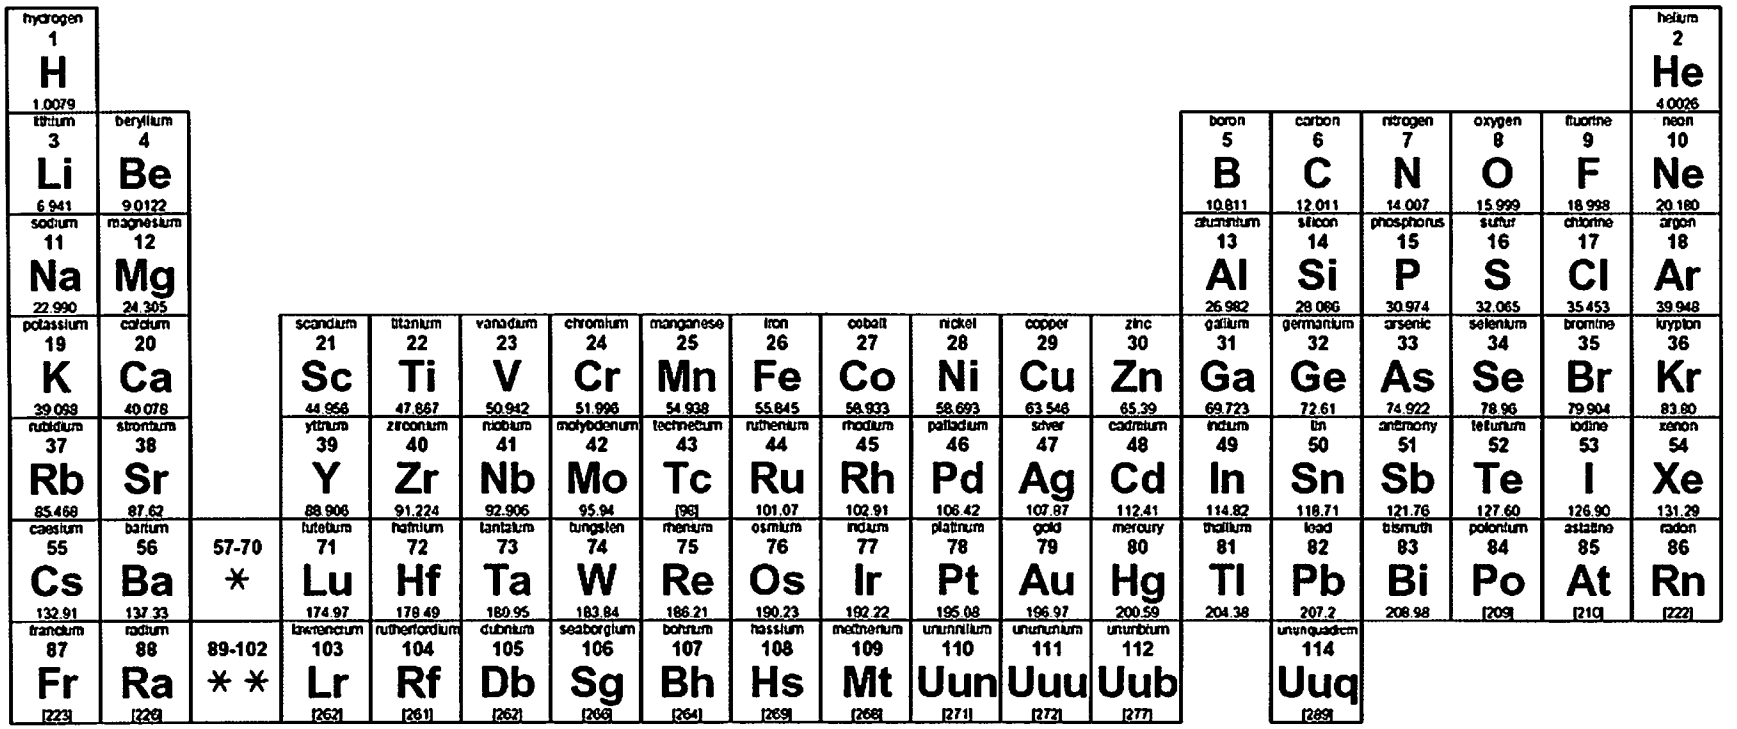


OR



*******BONUS Points (up to 3 points)*******

Draw the structure of Pyridine (C_5H_5N), and using the Polygon Rule, justify that it has an aromatic π system.



hydrogen 1 H 1.0079

Spring 2018 Org II Exam #1 Ch 14-17 (50 points)

Name: POLLY GUNROOL

*If you do **not** want your graded exam placed in the box outside my office, then please check here* ☐

1-10 are True / False. (10pts)

1) *Aromaticity* is a term used to describe very stable π bonding in certain special molecules. True

2) The oxygen atoms in oxetane and 1,4-dioxane are all sp^3 hybridized. True

3) *Conjugation* involves the sideways overlap of 3 or more adjacent and aligned p orbitals. True

4) Kinetic products are always formed more quickly than thermodynamic products. True

5)  is more stable than  True

6) For EAS reactions, alkyl groups are *ortho/para* directing, whereas acyl groups are *meta* directing. True

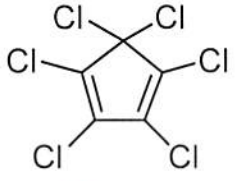
7)  is a *non-bonding* Molecular Orbital. F

8) For EAS, *all* deactivating substituents are *meta* directors. F

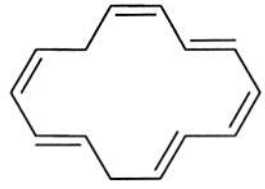
9) Friedel-Crafts *alkylations* produce acylium ion electrophiles which are resonance stabilized and so do not undergo carbocation rearrangement. F

10) For Diels-Alder reactions, the diene must adopt an *s-trans* conformation. F

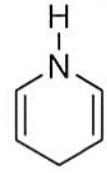
11) Indicate which of the following molecules are *aromatic*, *non-aromatic* or *anti-aromatic*. (Assume all the species are **planar**). (10pts)



Non-Ar

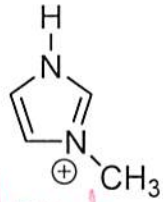


Non-Ar



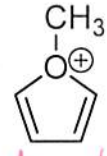
Non-Ar

Aromatic

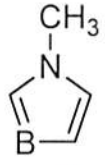


Aromatic

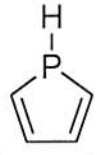
Aromatic



Aromatic



Aromatic



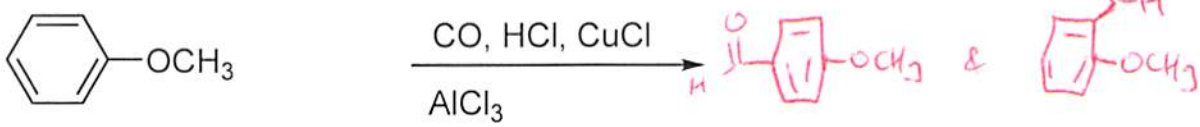
Aromatic

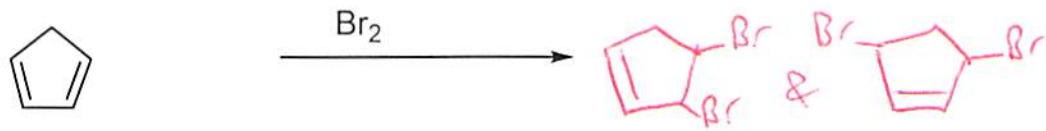
Aromatic

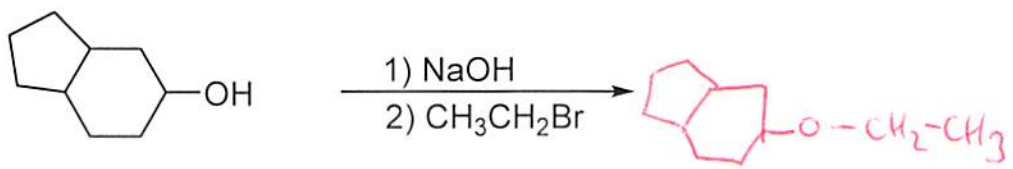
12) Provide a topic (or problem) for which Molecular Orbital Theory provided a superior explanation. (1pt)

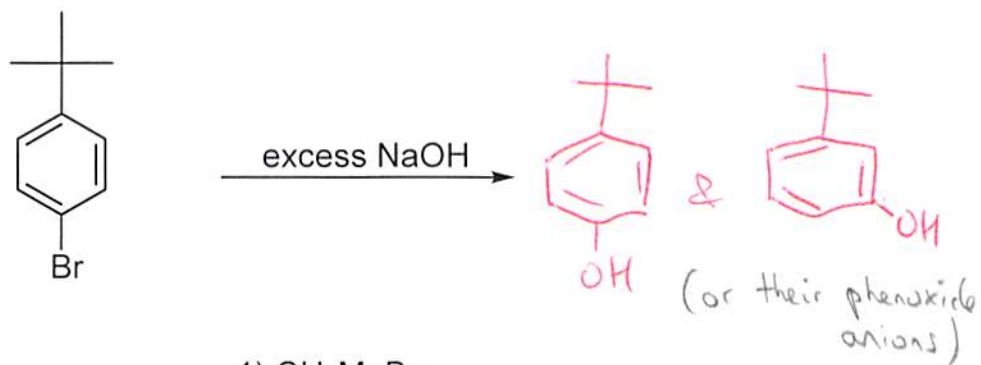
- stability of conjugation
- delocalized π bonding
- aromaticity
- HOMO/LUMO Interactions
- Woodward-Hoffman Rules
- ... etc

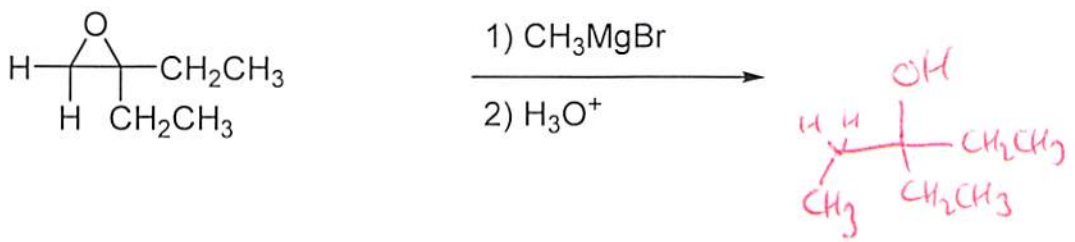
13) Predict the major products in the following reactions, *paying attention to regio/stereochemistry and isomeric products*, where applicable. (12pts)

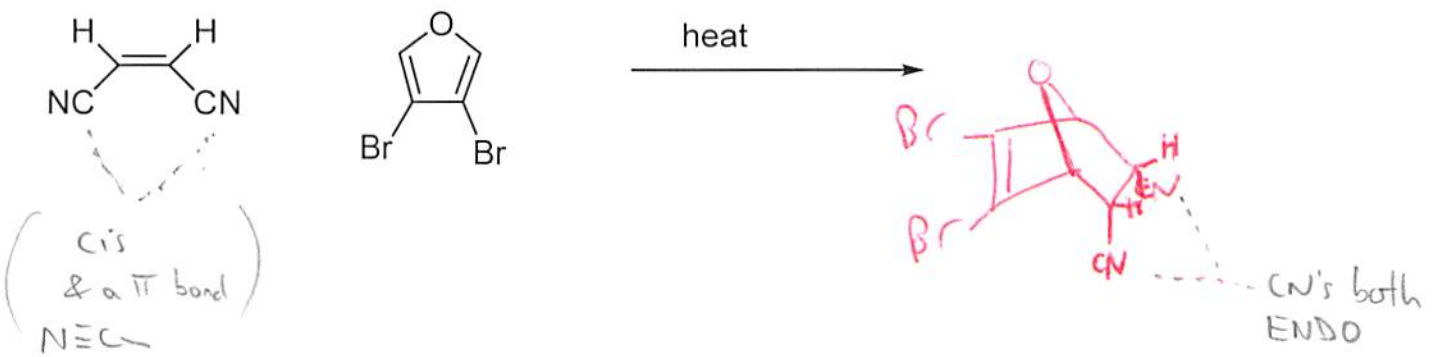




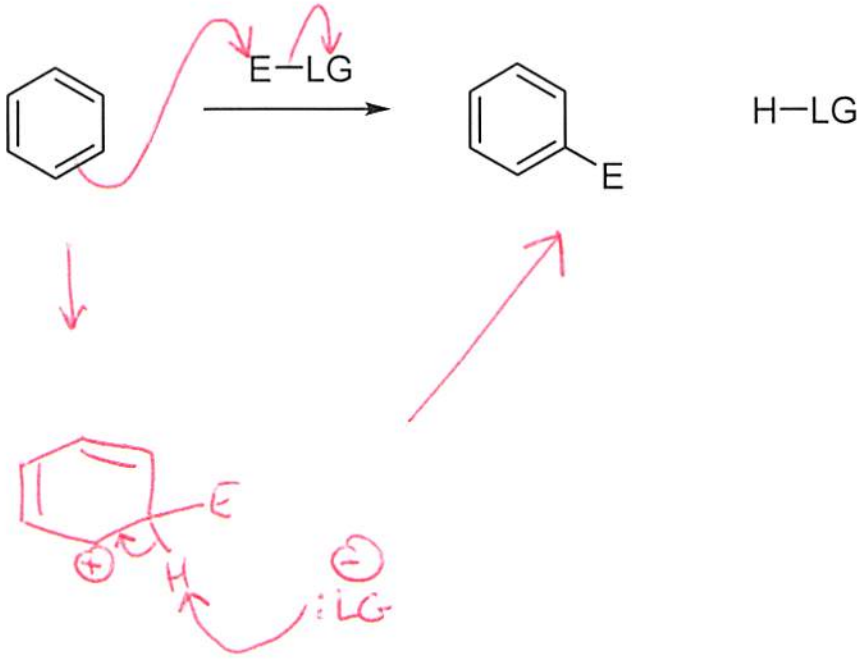




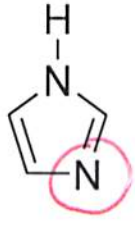




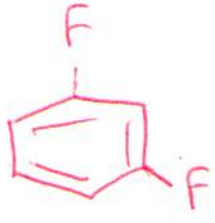
14) Write the mechanism (*i.e. curly arrows*) for the following generic Electrophilic Aromatic Substitution. (*You do **not** need to draw all the resonance structures of the intermediate sigma complex*). (4pts)



15) Circle the more basic Nitrogen in the Imidazole ring below. (1pt).

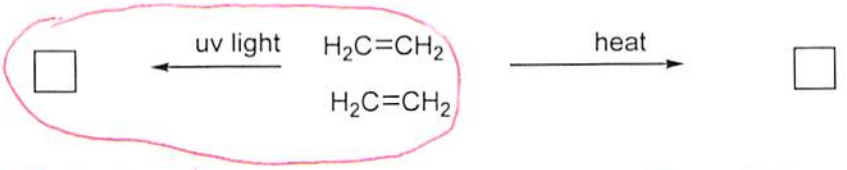


16) Draw *meta*-diFluoroBenzene. (1pt).



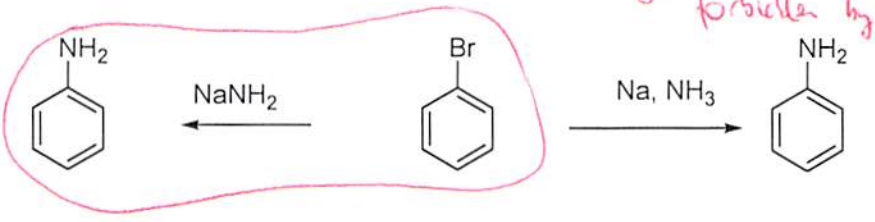
17) (4x2=8pts) For each pair of reactions (a-d), one reaction works better than the other. Indicate which one works best, and write a single sentence to explain why.

a)



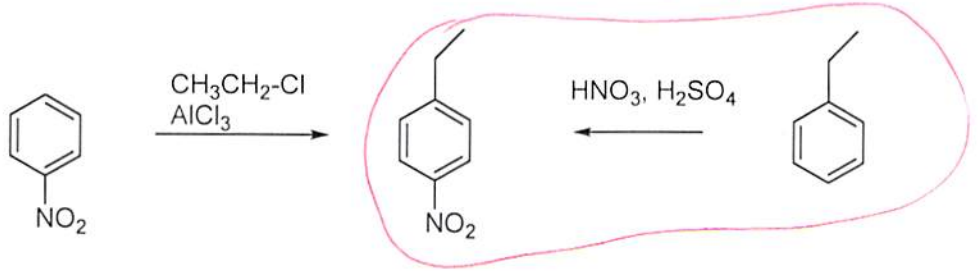
Reason: 2+2 cycloadditions are 'photochemically allowed' (but 'thermally forbidden by the W-H Rules).

b)



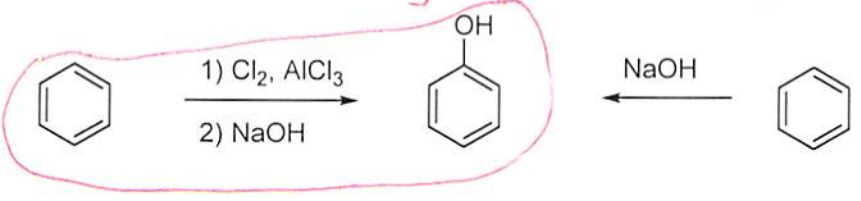
Reason: The $\ominus NH_2$ causes N.A.S whereas Na/NH_3 is Birch reduction.

c)



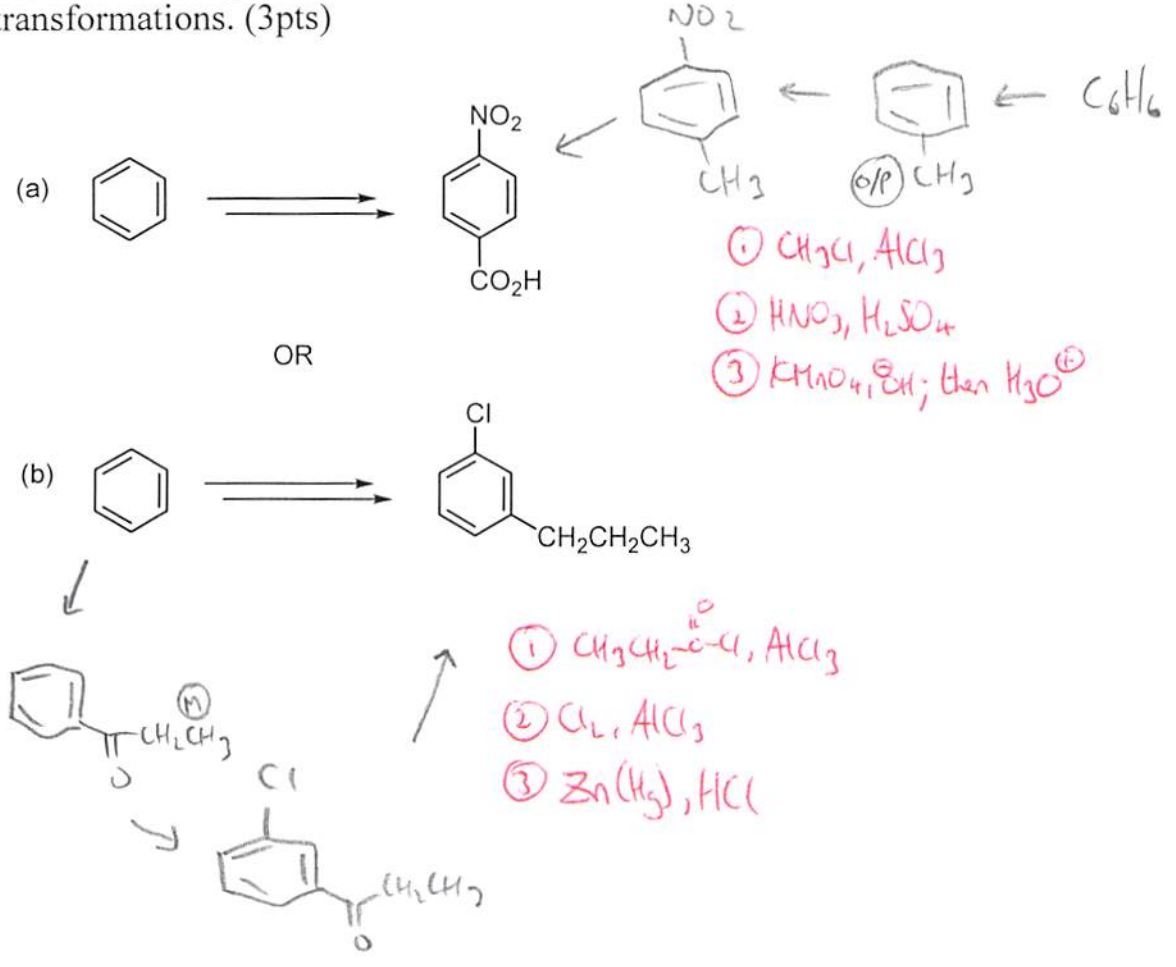
Reason: F.C alkylations do NOT work on deactivated aromatics, and also the 'directing effect' on the left is wrong.

d)



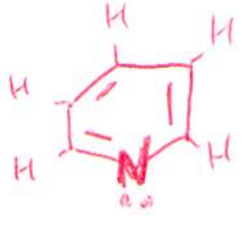
Reason: N.A.S. requires a leaving Group (such as Cl) to be substituted by the nucleophile.

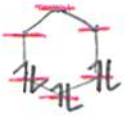
18) Provide reagents for *either* (a) <u>or</u> (b) which are obviously multistep transformations. (3pts)



*******BONUS Points (up to 3 points)*******

Draw the structure of Pyridine (C_5H_5N), and using the Polygon Rule, justify that it has an aromatic π system.





"closed bonding shell" arrangement = aromatic
